ABSTRACT

The American Pregnancy Association states that dieting during pregnancy can be quite challenging. Women gain around 10 to 12 kg during this period because they eat a greater variety of healthful meals. You should consume high-fiber meals like whole grains, beans, lentils, and water when you are pregnant. The purpose of the study was to determine the dietary habits and level of nutrition knowledge of first trimester (1–12 week) pregnant women. Techniques: The study was conducted in February and March 2019 at the O.P.D. Kamla Nehru Hospital in Shimla, Himachal Pradesh, using an experimental poll. A purposive sample of 400 first-time pregnant women, ranging in age from 1 to 12 weeks, was selected. Pamphlets with information were sent to Twenty-seven percent didn't know enough, and eleven percent knew enough. It was discovered that various sociodemographic characteristics were substantially correlated with the pregnant woman's

knowledge score about her sources of dietary information (0.031*). There was no other significant correlation found between this measure and any other sociodemographic variables. The study's findings indicate that primigravida women are underinformed about their health and what to do during the first 12 weeks of pregnancy. This indicates that in order to prevent more issues throughout pregnancy, women's perceptions need to shift as soon as feasible.

Keywords—Knowledge and Informational Booklet for Women Who Are Expecting

1. BACKGROUNDOFTHESTUDY

2. Because your body requires so many more resources during pregnancy, you gain around 10 to 12 kg. You should consume high-fiber meals like whole grains, beans, meats, and water when you are pregnant. Rekha Sharma (2004) Pregnant women's tissues are used to extract nutrients if their dietary supply is insufficient to fulfill their demands and those of the unborn

child. The mother's additional vulnerability increases the possibility of serious issues that might endanger her life. Additionally, it increases the likelihood that the newborn will be underweight and that he won't be able to feed himself effectively at first. 1. To survive, humans must eat, and what they consume has an impact on

3. NEEDFORTHESTUDY

4. The global rate of maternal mortality decreased by 44% between 1990 and 2015. In developing nations, there were 280 maternal deaths for every 100,000 live births in 2015. As per Himachal Pradesh Anaemia prevalence in the

ISSN: 1832-5505 Vol-10 Issue-02 July 2022

15–49 age group was 44.7% in rural areas and 37.5% in urban areas in 2013–14. The most recent study found that 50.2% of pregnant women who were anaemic did so because of that. Every year, more than 8 million infants are born with major birth defects globally (WHO) 3.

6. REVIEWOFLITERATURE

This study looked at 350 women in Tamil Nadu, India, who were getting ready to give birth. The poll was made to find out what people knew, how they felt, and what they did about diet, pregnant problems, and danger signs. About 98% of women were very clear that nutrition is important during pregnancy, and 53% said that the amount of food should be raised. One of the main places where people learned about eating was from family (81%). Sixteen percent of people who had this sign had stomach pain, and twenty two percent had vaginal bleeding. About 77% of women thought they should have at least 6–10 visits before they gave birth. The study's conclusion was that health workers should pay more attention to nutritional values and talk to women before they get pregnant about the importance of good nutrition, the parts and sources of a healthy diet, and the effects of being too or too little fed. 4

A detailed study asked 96 expecting women to find out about nutrition. Most of them (34.4%) got their information from family, coworkers, and friends. Four fifths of pregnant women (45.8%) still have the wrong idea about how often to eat green veggies, and the main reason they don't eat them (61.4%) is because they are too cold. People ate processed foods because they were easy to find, and 90% of pregnant women said that the media made them eat processed foods. Two-thirds of expecting women gave the right answer because they were taking iron pills. The study discovered that there is no link between how well women can read and write and how much they know about nutrition. About six out of ten women (59.3%) who were asked had some knowledge of nutrition, but only one woman who was four months pregnant had a lot of knowledge. Sixteen percent of pregnant women didn't know much.5

8. CONTENTRELIABILITY

ThereliabilityofthetoolwascalculatedbyusingCronbach'salpha,andthereliabilityofthetoolis0.92hencethetoolwas reliable for the study.

9. CONTENTVALIDITY

The validity was validated by an expert's opinion. The tool was given to 12 experts in the field of Obstetrics and Gynaecological Nursing, dietician, and Medicine department, after the valuable suggestions the tool was found to be complete in terms of clarity of language.

10. PILOTSTUDY

Studysetting: KamlaNehruHospital, Shimla

Study sample: Primigravida women of 1st trimester (1-12 weeks) were attending O.P.D in Kamla Nehru Hospital, Shimla at the time of data collection and who meets the inclusion criteria.

Sample size:38

Samplingtechnique: Purposives amplingtechnique

After obtaining formal permission from the authorities the pilot study was conducted on the 2nd week of February on 38 samples by using Purposive sampling Technique. The Researcher gave self-introduction, explained the purpose of the study and written informed consent was obtained from the samples. The data was collected from the samples by using self- structured checklist and knowledge questionnaire.

11. ETHICALCONSIDERATIONS

- (a) Theproposal waspresented infrontoftheInstitutionalresearchcommitteeand ethicalclearancewasobtained.

- (f) Theanonymityandconfidentialitywere protectedthroughoutthestudy.
- (g) Professional normswere maintained.

12. APLANFORDATAANALYSIS (DESCRIPTIVEANDINFERENTIAL)

The data analysis was done according to the objectives of the study. Both descriptive and inferential statistics were used.

12.1 DescriptiveAnalysis

- Frequencyand percentage is used to analyzed the socio-demographic profile of the subjects
- MeanandStandardDeviation is usedtoanalyzed the dietary patterns of antenatal women.

12.2 Inferential Analysis

A chi-square test was used to find the association between the knowledge regarding dietary patterns with the selected socio-demographic variables.

13. ANALYSISOFtheMAINSTUDY

Data analysisand interpretation

In the current study data analysis is done in the following sections:

Table No 3 Depicts that the knowledge scores of dietary patterns among study subjects with their selected socio-demographic variables were calculated by using chi-square. The result revealed that antenatal women's Sources of information regarding diet (0.031*) was found significant with other socio-demographic variables. No other significant association was found with other socio-demographic variables.

14. MAJORFINDINGSOFTHESTUDY

- 15. The study's main conclusions were as follows: of the 400 participants, 57% had good dietary patterns, 42.3 % had average dietary patterns, and 0.7% had poor dietary patterns based on their responses to the study's 28 closedended questions regarding dietary patterns during pregnancy.
 - Of the 400 participants, 61.3 percent of expectant women had moderate awareness, 11.7 percent had good knowledge, and 27% had poor understanding about food during the prenatal period.
 - There is no significant correlation between the level of scores and demographic variables like age, religion, type of family, women's education status, occupation, family income per month (in rupees), and area of residence, with the exception of one variable source of diet-related information. Compared to the table, the computed chi-square values were lower.
